
Chapter -3

Diabetes: The Silent Source of Multiple “Incurable” Diseases

3.1 True Stories: Real Human Experiences

1. HbA1c Reduced from 9.1 to 5.0 in One Month: Evidence of Metabolic Rejuvenation Through Targeted Nourishment

A True Observational Story (Name Changed)

Rathna was just **37 years old**—busy with life, family, and responsibilities—when her body began sending her quiet warning signals.

There was no dramatic pain.

No emergency.

Just a persistent **uneasiness** she couldn't explain.

Like many people, she tried to ignore it at first. But when the discomfort refused to fade, she decided to do what most of us do only when the body insists—she went for a blood test.

The report brought unexpected news.

Her blood sugar levels were **abnormally high**, and her **HbA1c was 9.1%**, a value that reflects prolonged metabolic imbalance. The doctors she consulted were clear and direct: *“You should start medication immediately.”*

Medically, the advice was correct.

But emotionally, Rathna and her family were shaken.

A Different Question

Rathna's husband had been familiar with **my science and treatment protocols**, having seen how metabolic and lifestyle-based approaches could support the body when applied early. Instead of rushing into fear, he asked a different question:

“Before suppressing the numbers, can we support the body to correct itself?”

With this understanding, Rathna and her family came to us. She was evaluated by our doctors, and a **structured nutritional and lifestyle protocol** was initiated—focused on reducing metabolic burden, restoring nourishment, and allowing the body's natural regulatory intelligence to function without obstruction.

This was not about rejecting medicine.
It was about **listening to the body before it reached a point of no return.**

The First Change: The Body Speaks Back

Within **10 days**, something remarkable—but quiet—happened.

The uneasiness that had troubled Rathna disappeared.

There was no dramatic announcement. No sudden declaration of cure.
Just a simple realization one morning:

“I feel normal again.”

Her energy improved.
Her comfort returned.
Her body felt lighter.

This was the first sign—not on paper, but in lived experience—that metabolic stress was easing.

Watching the Numbers Without Chasing Them

Normally, HbA1c is checked once every three months. But in this case, we chose a different path—not to chase numbers, but to **observe the body’s response more closely.**

We decided to monitor her parameters **every month**, not to prove anything, but to understand **how quickly the body adapts when burden is reduced** and nourishment is restored.

In **December 2025**, about one month after starting the protocol, Rathna repeated her blood test.

The result surprised everyone.

Her **HbA1c had reduced from 9.1% to 5.0%.**

What This Meant—and What It Did Not

This change was not viewed as a declaration of cure.
It was understood as a **signal.**

A signal that:

- Excess glucose exposure had reduced
 - Metabolic efficiency had improved
 - The body was no longer under the same physiological stress
-

More importantly, it suggested that **organs were responding quickly**, and the **whole body was moving toward rejuvenation** when given the right environment.

Healing, in this science, is not forced.
It is **allowed**.

A Larger Reflection

Rathna's story is not unique—but it is deeply instructive.

It shows how:

- The body often whispers before it screams
- Early metabolic imbalance can still be reversible in function
- When nourishment replaces suppression, the body responds with intelligence

Most importantly, it reminds us that **numbers are not the disease**.
They are messages.

And when we listen early, the body often remembers how to heal.

A Note of Responsibility

This story is shared as a **real-world observation**, not as medical advice or a universal guarantee. Each body responds differently, and professional medical guidance remains essential.

But Rathna's journey stands as a reminder:

Before the body collapses, it asks to be understood.

2. From 14.9 to 6.4 in 90 Days: When Proper Nourishment Reawakened the Body's Power—Neuropathy and Retinopathy Receded, Strength Returned" A *True Observational Story (Name Changed)*

Krishna never imagined that diabetes could make him feel this weak.

Once a healthy man weighing **85 kilograms**, his body slowly began to change. The strength he once took for granted faded. His weight dropped rapidly to around **70 kilograms**. Simple daily tasks felt exhausting. His vision became **blurry**, headaches appeared without warning, and a constant sense of weakness followed him everywhere.

When he finally went for blood tests, the reports were alarming.

His blood sugar levels were dangerously high:

- **Before food:** above **328.25 mg/dL**
- **HbA1c:** **14.9%**

These numbers reflected not just high sugar—but a body under **severe metabolic stress**.

Fear Beyond the Diagnosis

Krishna immediately began **conventional allopathic treatment**. Medicines were started, dietary restrictions were imposed, and long-term management plans were explained.

But something inside him broke.

He began to think:

“Will I have to take medicines for my entire life?”

“What if more complications come later?”

“Why are so many foods suddenly forbidden?”

The diagnosis did not just affect his body—it affected his **mind**. The fear of lifelong dependency and progressive complications weighed heavily on him. Food, once a source of nourishment and joy, now felt like a list of permanent restrictions.

Slowly, Krishna became mentally exhausted.

A New Direction

Krishna’s wife had been quietly watching videos on our **YouTube channel**, learning about a different understanding of disease—one that spoke about **nourishing the body rather than suppressing symptoms**.

She believed that before resigning themselves to fear, they should at least explore this path.

And so, at the **end of April 2025**, they came to us.

Not with expectations of miracles,

but with a simple hope:

“Is there another way?”

Beginning the Protocol

Krishna was evaluated by our doctors and placed on a **defined dietary protocol combined with herbal formulations**, under supervision. The approach focused on:

- Reducing metabolic burden
 - Supporting digestion and gut health
 - Nourishing underfed cells
 - Allowing the body’s inbuilt regulatory systems to function
-

This was not about fighting diabetes.
It was about **removing the obstacles to healing**.

The First Signs: Ten Days That Changed Everything

Within just **10 days**, the first changes appeared.

The **headaches disappeared**.

The **blurry vision cleared**.

The constant weakness that haunted him for months began to fade.

For the first time in a long while, Krishna felt **normal** again.

This early response was seen as a sign that the body was no longer struggling under extreme metabolic stress.

Three Months Later: The Body Reclaims Balance

By **July 2025**, Krishna returned with fresh blood reports.

The numbers told a remarkable story.

- **HbA1c had reduced from 14.9% to 6.7%**
- **Fasting blood sugar 109 mg/dl**
- **Mean blood glucose 145 mg/dl**
- **Post Prandial Blood 145 mg/dl**
- Blood sugar parameters were approaching normal ranges
- His **weight increased by nearly 10 kilograms**, returning strength to his frame
- Weakness had completely disappeared

His energy was back.

His confidence returned.

Life no longer revolved around fear.

Continued Improvement

Krishna continued following the **same defined diet protocol and herbal formulations**, allowing his body time to stabilize rather than rushing change.

When he returned again in **September 2025**, his reports showed further improvement.

- **HbA1c had reduced to 6.0%**

This steady progression reflected **sustained physiological adaptation**, not short-term suppression.

What Krishna's Story Teaches Us

Krishna's journey is a powerful reminder of something we often forget:

The human body is not weak.
It is often **undernourished and overburdened**.

When the right nourishment is restored and metabolic stress is reduced, the body's **inbuilt intelligence awakens**.

This story is not about denying modern medicine.
It is about understanding that **healing begins when nourishment replaces fear**.

A Note of Responsibility

This narrative is shared as a **real-world observation**, not as medical advice or a universal guarantee. Individual responses vary, and professional medical guidance remains essential.

But Krishna's experience stands as a quiet truth:

The body has enormous power to rejuvenate—
if we give it what it truly needs.

3. Twelve Years of Uncontrolled Diabetes Ended on Day One: 48 Units of Insulin Stopped When a Different Path Began"

A True Observational Story

For more than **twelve years**, diabetes had been a constant companion in Stanely (name changed) life.

At **52 years of age**, living in Bengaluru, Stanely had tried everything modern medicine offered. Insulin injections had become routine. Oral medications were taken faithfully. Nutritional supplements were added one after another. Yet, despite strict compliance, his blood sugar numbers refused to come down.

His body was tired.
His sleep was broken.
And his confidence in recovery was slowly fading.

A Body Under Constant Stress

When Mac came to us, his blood reports told a troubling story:

- **Fasting Blood Sugar:** 339 mg/dL
-

- **Postprandial Blood Sugar:** 475 mg/dL
- **HbA1c:** 9.9%

These were not numbers of a newly diagnosed patient.

They reflected **long-standing metabolic stress**, despite high insulin doses—nearly **48 units per day**—and multiple oral medications.

Beyond the reports, Mac spoke about his daily life.

He felt exhausted most of the time.

His body ached without reason.

Sleep rarely came easily—some weeks, he spent **two full nights without sleep**.

Diabetes, for him, was no longer just a blood sugar problem.

It had become a **whole-body disorder**.

Asking a Different Question

When Mac was introduced to our doctors, the approach taken was different from what he was used to.

Instead of asking, *“How much insulin is needed?”*

The question was:

“Why is the body unable to use what it already has?”

Our science is based on a simple but often ignored understanding:

cells do not fail because medicines are missing, but because nourishment and circulation are compromised.

Mac agreed to follow a **Neo Ayurveda Miracle Drinks–based protocol**, along with a **defined dietary plan**, under medical supervision. The focus was not on suppressing blood sugar, but on **supporting cellular nourishment, gut health, and microcirculatory flow**.

A Bold but Monitored Step

On **Day 1** of the protocol, insulin was discontinued.

Oral medications were temporarily continued.

This decision was not taken lightly. It was closely observed, supported by daily monitoring, and guided by the patient’s response rather than rigid timelines.

What followed surprised even the patient himself.

The First Ten Days: The Body Responds

Within **ten days**, Mac noticed changes that no report could fully explain.

His **energy returned**.

The constant body pain disappeared.

For the first time in years, **sleep came naturally**.

There was no sudden miracle—just a steady sense that the body was no longer struggling against itself.

This phase was understood as **functional recovery**, where metabolic stress was reducing and cellular systems were beginning to respond once again.

One Month Later: The Numbers Speak

After **one month**, repeat blood tests were conducted.

The results showed a clear shift:

- **Fasting Blood Sugar:** reduced to 141 mg/dL
- **Postprandial Blood Sugar:** reduced to 172 mg/dL
- **HbA1c:** reduced to 7.5%

These changes occurred **without insulin**, a fact that stood out strongly when compared to Mac's previous six years of dependency.

Rather than being viewed as a “cure,” these results were seen as **evidence of metabolic recalibration**—a sign that the body was regaining its ability to regulate glucose more efficiently.

What Changed Inside the Body

The protocol emphasized **cellular nourishment** through herbal formulations that functioned as **prebiotics and nutrient carriers**, supporting gut microbiota and improving nutrient absorption.

Improved gut health appeared to influence:

- Better insulin sensitivity
- Reduced oxidative stress
- Improved microvascular circulation

As blood flow improved at the capillary level, **nutrients could finally reach undernourished tissues**, including pancreatic cells.

This helped explain not only the improvement in blood sugar, but also:

- Better sleep
 - Reduced fatigue
 - Improved tolerance at the kidney and cardiovascular levels
-

The body was not being forced—it was being supported.

A Larger Understanding

Stanely story highlights an important truth:

Diabetes is not merely a disease of sugar.
It is a disease of **cellular starvation and circulatory blockage**.

When these root issues are addressed—through nourishment, gut balance, and microcirculatory support—the body often begins to repair itself in ways that conventional symptom-focused treatments cannot achieve alone.

A Note of Responsibility

This story is shared as a **real-world observation**, not as medical advice or a universal promise. Every body is different, and professional medical supervision is essential.

Yet Stanely journey reminds us of something deeply important:

When the body is given the right environment,
it often remembers how to heal.

4. Remarkable Glycemic Reversal in Type 1 Diabetes: HbA1c Reduced from 18.6% to 6.7% with Significant Weight Gain in 74 Days

This case describes an **11-year-old patient (2025)** diagnosed with **Type 1 Diabetes** after a delayed clinical recognition despite multiple consultations.

1. Clinical History and Diagnosis Timeline

- **June–September 2025:**
The patient began experiencing progressive weakness, weight loss, reduced activity, and frequent urination. Multiple pediatric consultations were undertaken; however, diabetes was not diagnosed. Routine blood tests were reported as normal, as blood glucose was not specifically evaluated.
 - **December 2025:**
On presentation with worsening symptoms—**frequent urination, severe weakness, loss of interest in activities, and marked weight loss (down to 27 kg)**—a blood glucose test was finally conducted, revealing a critically elevated level of **658 mg/dL**.
The patient was **hospitalized** and managed conventionally.
 - **January 2, 2026:**
The patient was discharged on insulin therapy.
-

- **January 5, 2026:**

The patient was initiated on **Dr. Raju's treatment protocol**, which included:

- Sugar care (morning and evening)
- Cardiovascular support
- Renal support
- Edemax powder and Graviola capsules
- A structured **flax-based diet** (flax seeds and flax oil)

2. Condition at Initiation of Treatment (Jan 5, 2026)

At the time of starting the protocol, the patient's condition was severely compromised:

- Very thin and undernourished (27 kg)
- Physically inactive; unable to walk normally
- Persistent fatigue and weakness
- Low appetite
- Frequent urination

The patient was on **insulin therapy: 7 units three times daily (total 21 units/day)**, with additional corrective doses as required. Despite this, blood glucose levels frequently remained **above 300 mg/dL**.

3. Early Clinical Response (Within 4–5 Days)

- Reduction in frequent urination
- Noticeable improvement in activity and responsiveness
- Gradual return of normal walking ability
- Decrease in fatigue
- Improvement in appetite

4. Progressive Insulin Reduction and Metabolic Stabilization

- **Every 10 days:** Insulin dosage was cautiously reduced by **1 unit per dose (morning, afternoon, evening)** based on blood glucose monitoring and clinical response.
- This tapering was conducted under observation using a **stepwise, response-guided approach**.

5. Clinical Outcomes as of March 24, 2026

After **74 days of treatment**, the following outcomes were documented:

- **Insulin reduced from 21 units/day → 6 units/day**
(2 units each in the morning, afternoon, and evening)
- **Blood Glucose Control:**
 - Fasting: **80–100 mg/dL**
 - Postprandial: **160–168 mg/dL**
- **HbA1c:** Reduced from **18.6% → 6.7%**
- **Physical Recovery:**
 - Weight increased from **27 kg → 33 kg**
 - Normal activity levels restored
 - Improved appetite and nutritional intake
 - No fatigue; active and engaged in daily life

6. Clinical Significance

This case demonstrates a **rapid and sustained improvement in glycaemic control**, accompanied by **significant reduction in insulin requirement and marked physical recovery** within a defined time frame.

While this represents an **observational outcome in a single case**, it highlights the possibility that, under specific conditions and careful monitoring, **metabolic stabilization and functional improvement may be achievable even in Type 1 Diabetes**.

Note

These findings are observational and require **systematic clinical validation, reproducibility, and controlled studies** before broader clinical application.
